

Dominating Shadow DOM

Tomomi Imura (@girlie_mac)

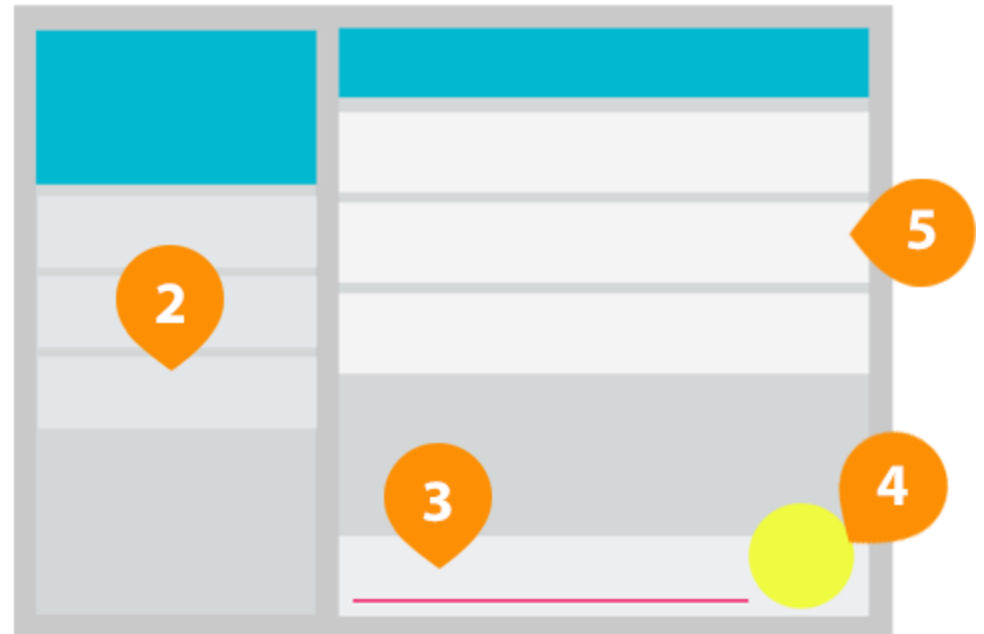

Creating Web UI

```
<div id="body-content-background">
  <div id="body-content-wrap">
    <div class="content-holder">
      <div class="content-container">
        <div class="content">
          <div class="nav">
            <div class="nav-container">
              <div class="mod-nav">
                <div class="mod-nav-inner">
                  <div class="nav-title">
                    <h2>Hello</h2>
                  <div class="nav-content">
                    <div class="list-container">
                      <div class="layout-ist-container">
                        <div class="layout-wrapper-01">
                          <div class="layout-inner">
                            <div class="layout-dummy">
                              <div class="layout-list">
                                <div class="layout-list-inner">
                                  <div class="layout-ul-a">
                                    <ul class="list-01">...</ul>
                                  </div>
                                </div>
                              </div>
                            </div>
                          </div>
                        </div>
                      </div>
                    </div>
                  </div>
                </div>
              </div>
            </div>
          <div class="layout-nav-bottom">...</div>
        </div>
      </div>
    </div>
  </div>
</div>
```

Bleh!

Modular UI

```
<core-scaffold>
  <core-header-panel>
    <core-toolbar>Chat Room</core-toolbar>
  </core-header-panel>

  <template repeat="{{m in messages}}">
    <x-chat-list uuid="{{m.uuid}}" text="{{m.text}}"></x-chat-list>
  </template>

  <paper-input on-keyup="{{checkKey}}"></paper-input>
  <paper-fab icon="send"></paper-fab>
</core-scaffold>
```

W3C Web Components

- **HTML Imports**
- **HTML Templates**
- **Custom Elements**
- **Shadow DOM**

Shadow DOM

Shadow DOM enable markup to:

- be composed in modular pattern
- be encapsulated (Private)
- overlay subtree of nodes

Shadow DOM Browser Supports

with vendor prefix

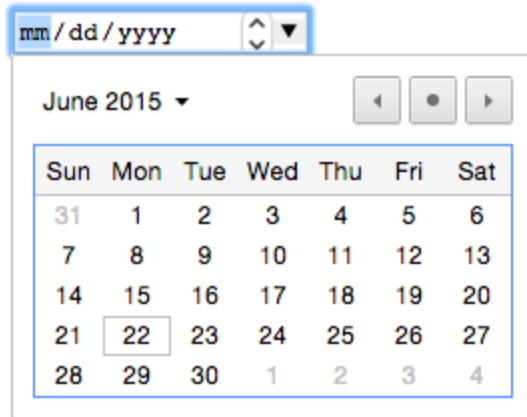

no vendor prefix

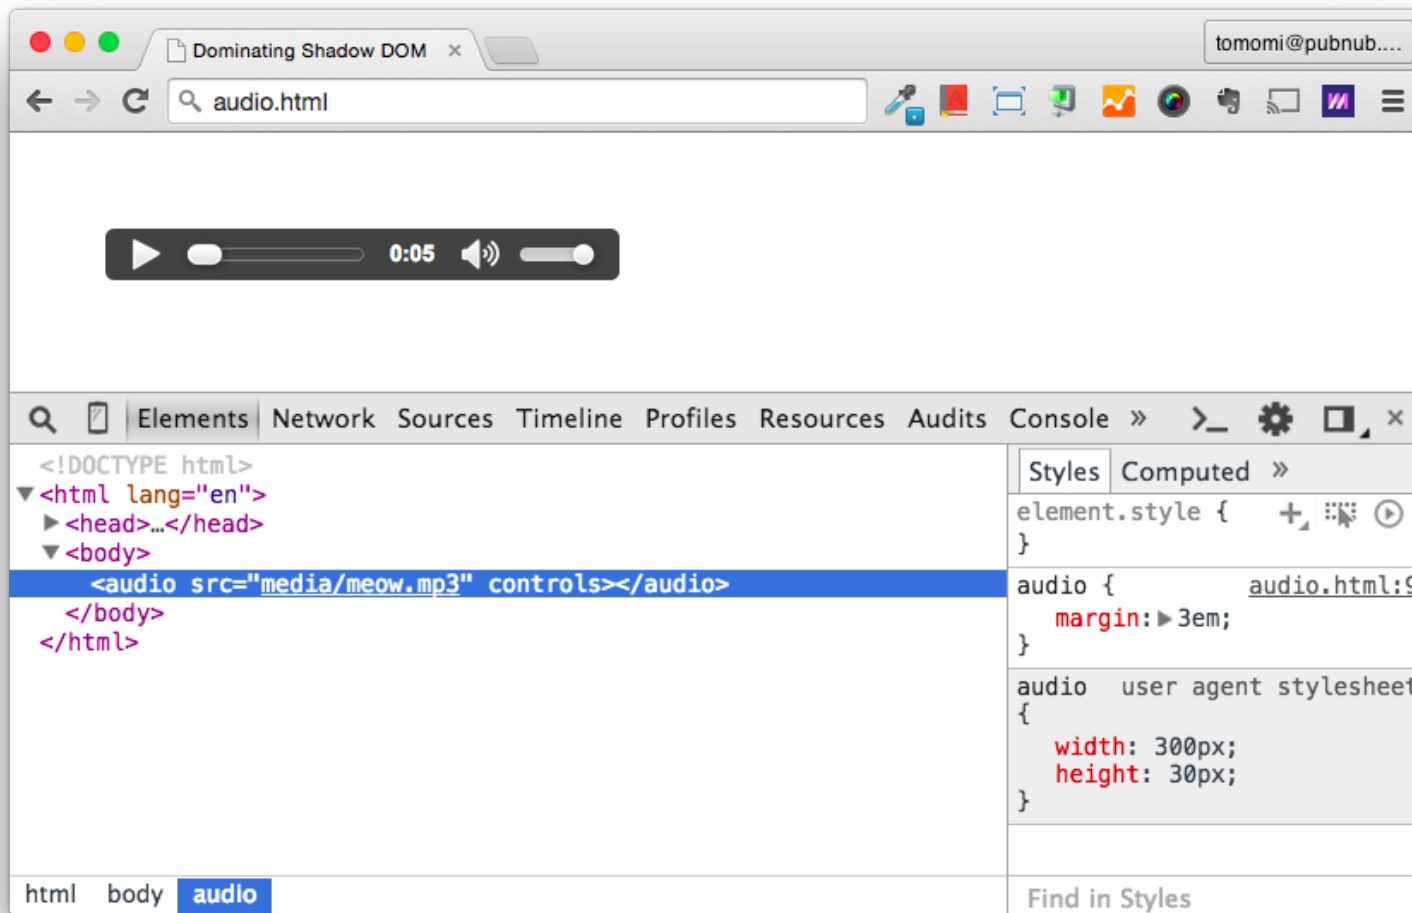

Shadow DOM in Browser

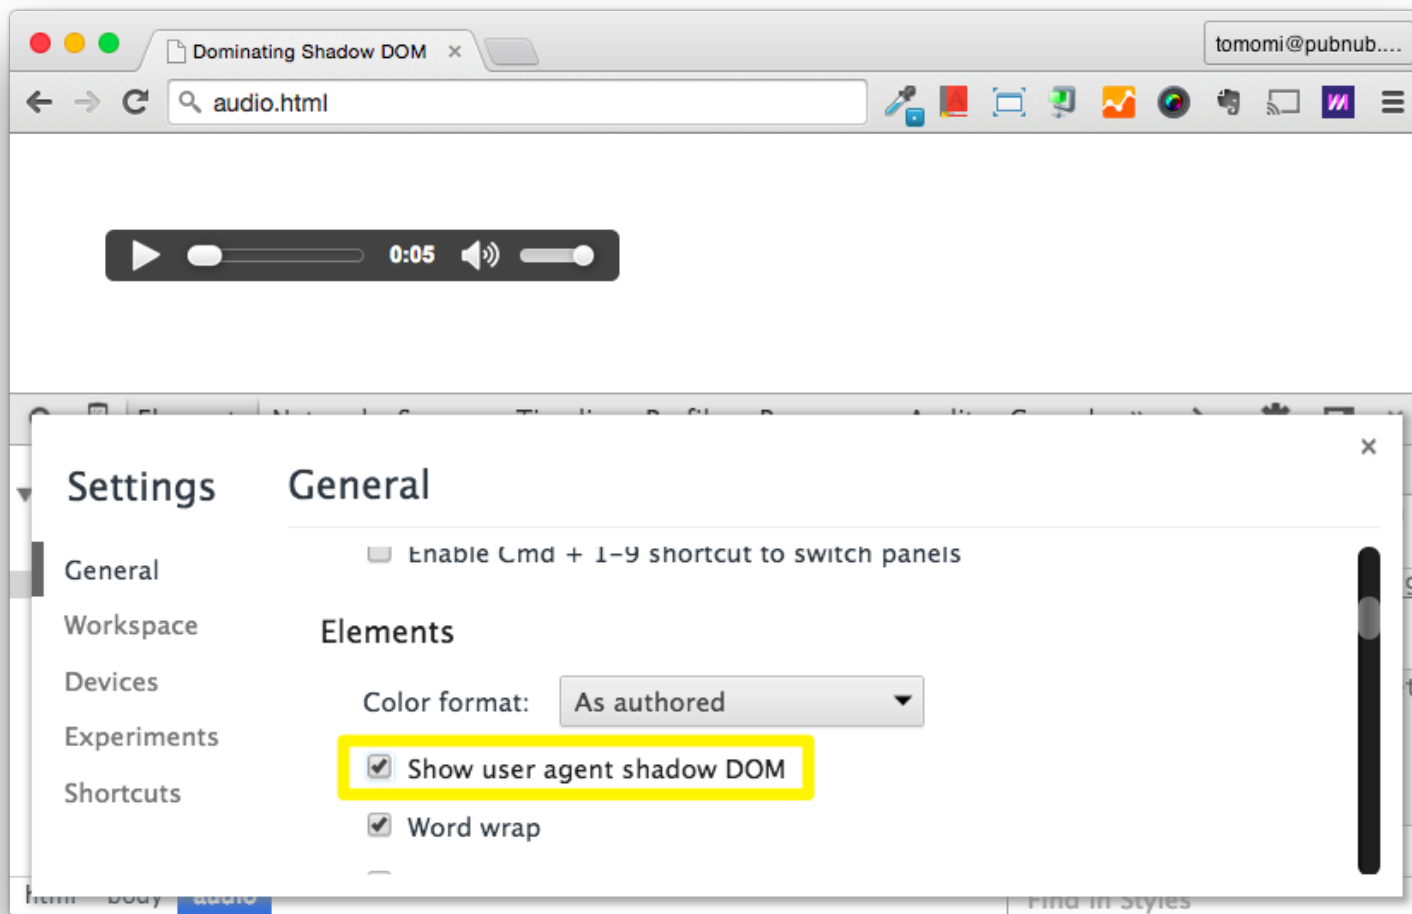

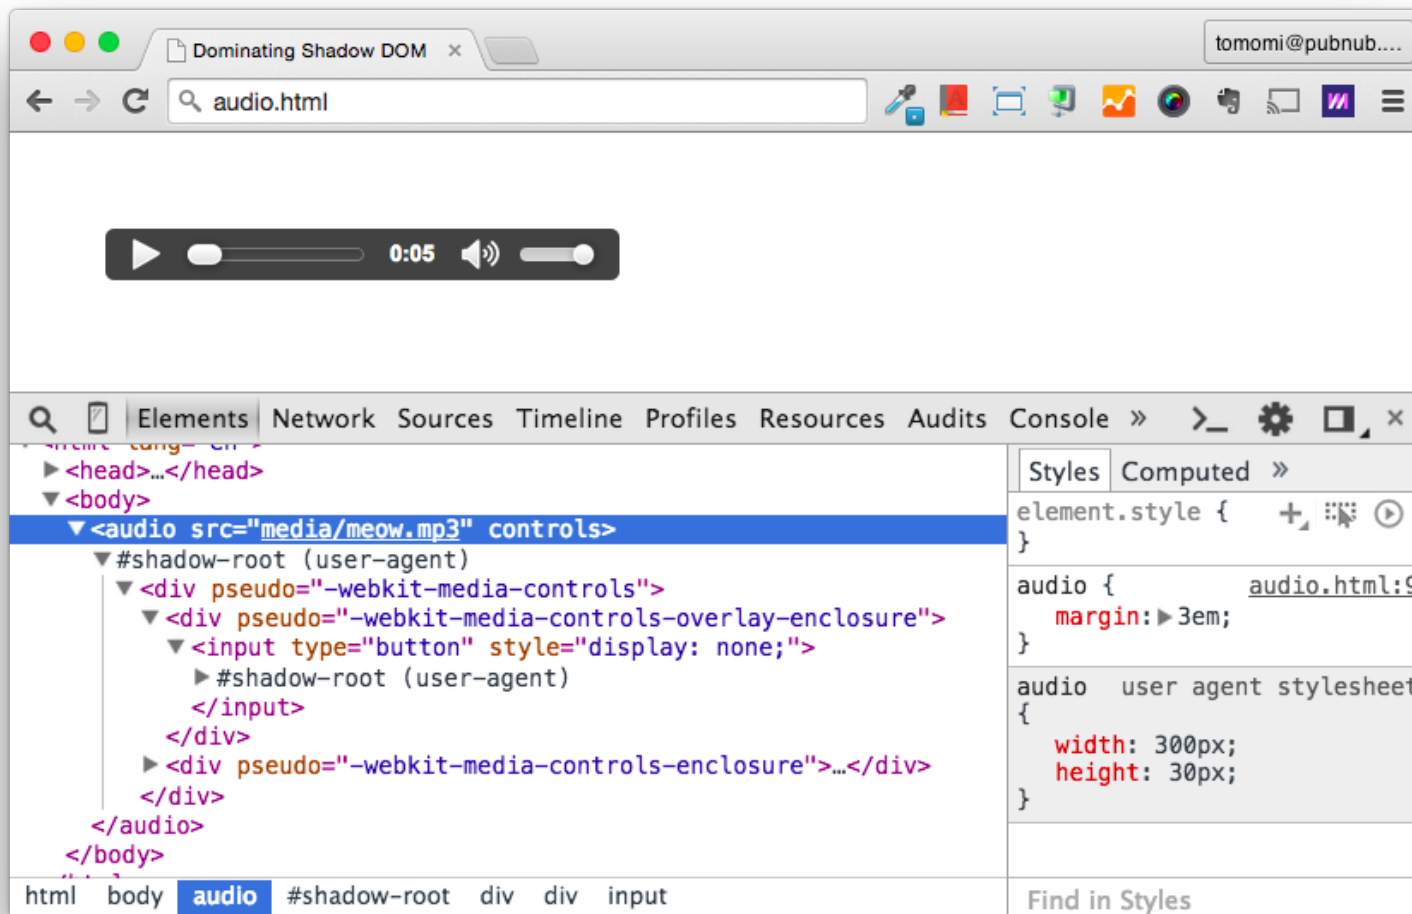

```
<audio src="media/meow.mp3" controls></audio>
```

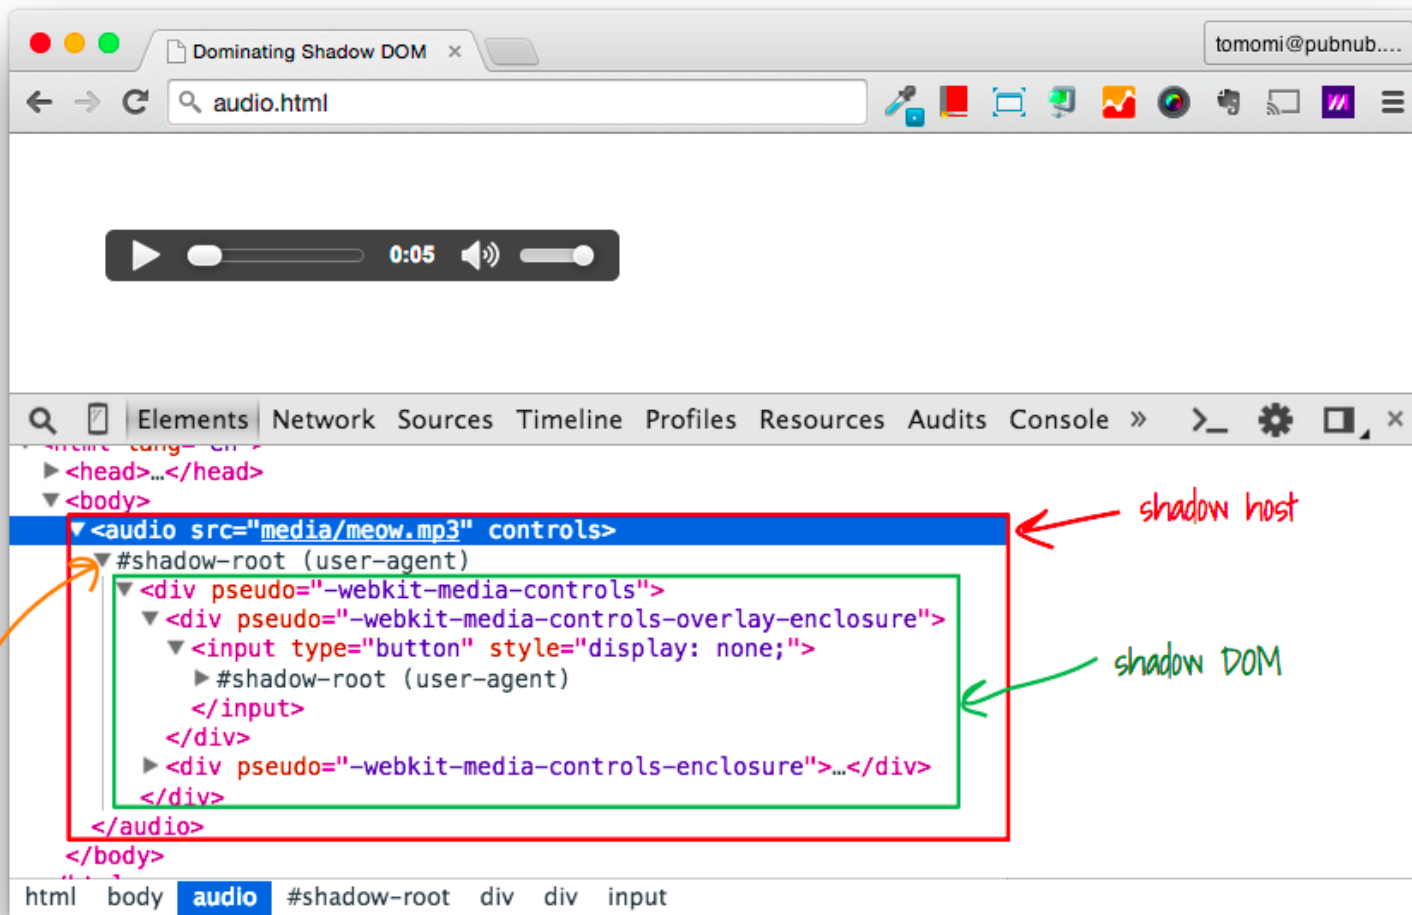

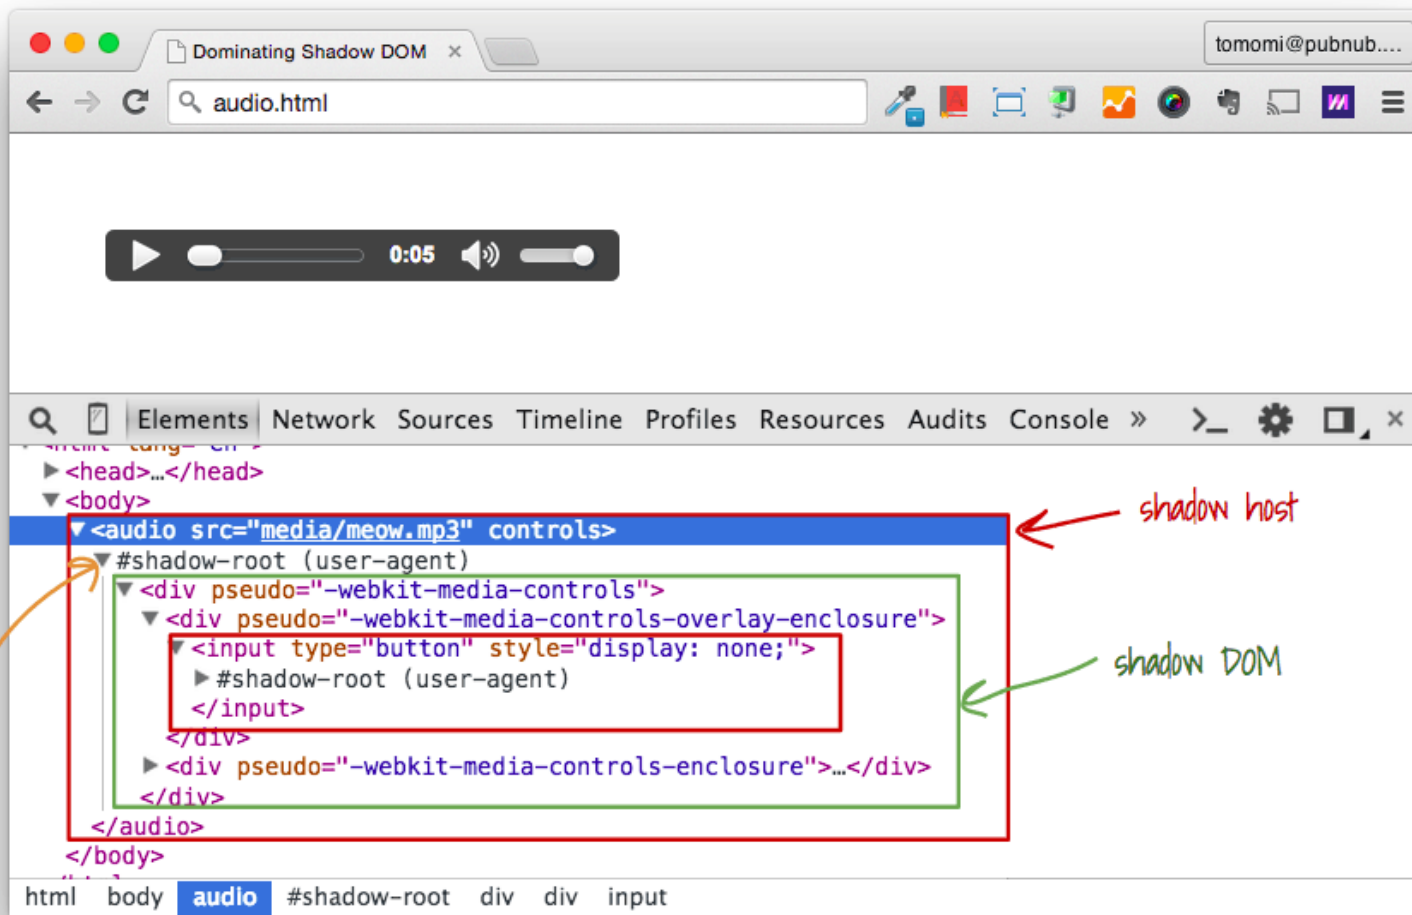

```
<input type="date">
```

Custom Elements

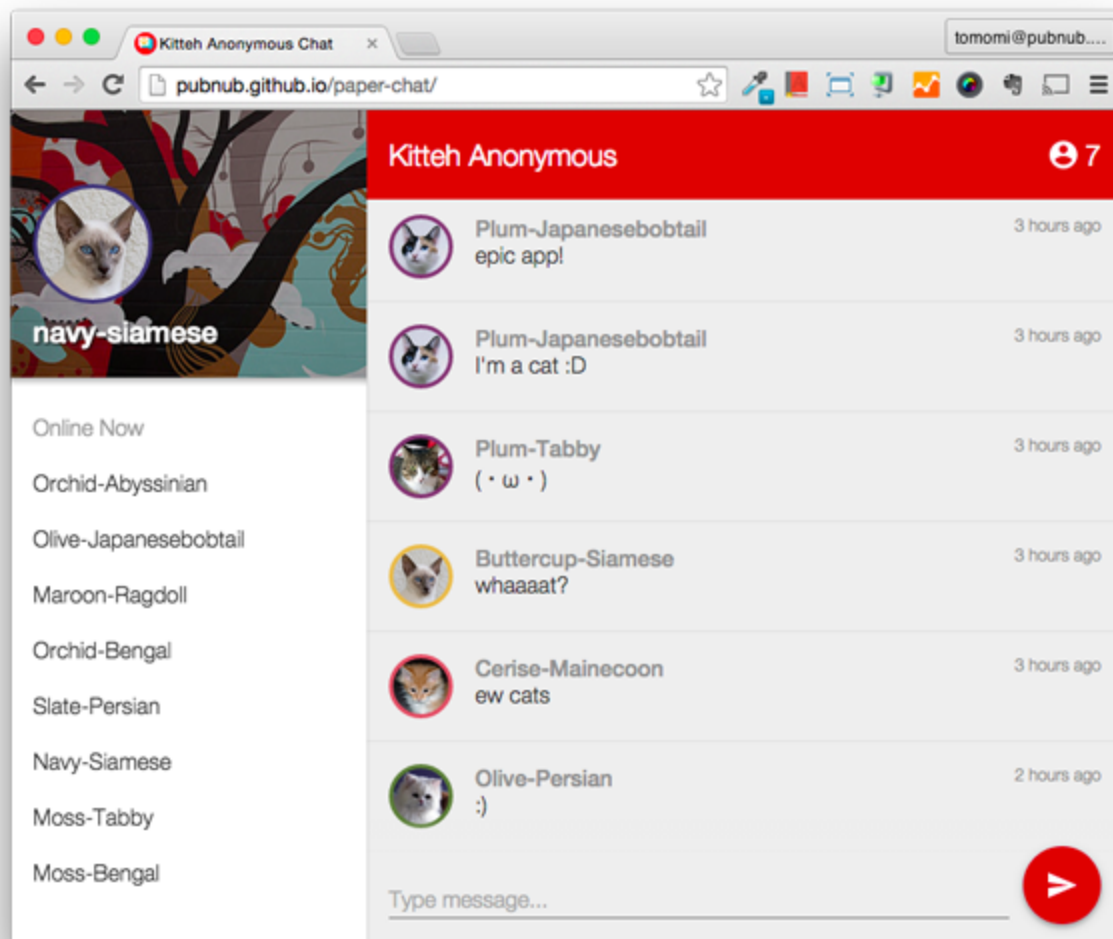

```
<x-chat-list
```

```
  color="moss" avatar="korat" username="Moss-Korat"
```

```
  text="happy moew year to you all"
```

```
  timestamp="a minutes ago"></x-chat-list>
```

<x-chat-list> element
(= shadow host)

shadow root

shadow DOM

The screenshot shows a web browser window with the address bar at `pubnub.github.io/paper-chat/`. The page title is "Kittah Anonymous" and the user is logged in as `tomomi@pubnub...`. The chat interface displays a user named "navy-siamese" with a cat avatar and the message "woof". A red arrow points from the `<x-chat-list>` element in the DOM to the "navy-siamese" chat entry. The developer tools are open, showing the DOM tree on the left and the Styles pane on the right. The DOM tree highlights the `#shadow-root` and the `<x-chat-list>` element. The Styles pane shows the default styles for the `:host` selector.

Elements | Network | Sources | Timeline | Profiles | Resources | Audits | Console | PubNub | 1 | ⚙ | 📄 | 🔍

timestamp="{{message.timestamp}}"></x-chat-list>
▼ <x-chat-list color="{{message.color}}" avatar="{{message.avatar}}" username="{{message.uid}}" text="{{message.text}}" status="{{message.status}}" timestamp="{{message.timestamp}}">>
 ▼ #shadow-root
 ▶ <style>...</style>
 ▼ <section class="user-list" layout horizontal>
 ▶ <div class="avatar navy" style="background-image: url(images/siamese.jpg)">...</div>
 ▼ <div flex>
 <div class="username">navy-siamese</div>
 <div class="text">woof</div>
 </div>
 <time class="timestamp" is="relative-time" datetime="2015-03-16T02:17:36.345Z" title="Mar 15, 2015, 7:17 PM PDT">3 minutes ago</time>
 </section>
 </x-chat-list>
</div>
<div class="shin"></div>

Styles | Computed | Event Listeners | ▶

element.style {
}

:host {
 display: block;
 position: relative;
 width: 100%;
 border-bottom: 1px solid #e0e0e0;
 font-size: 16px;
 min-height: 72px;
 z-index: 0;
}

Inherited from body

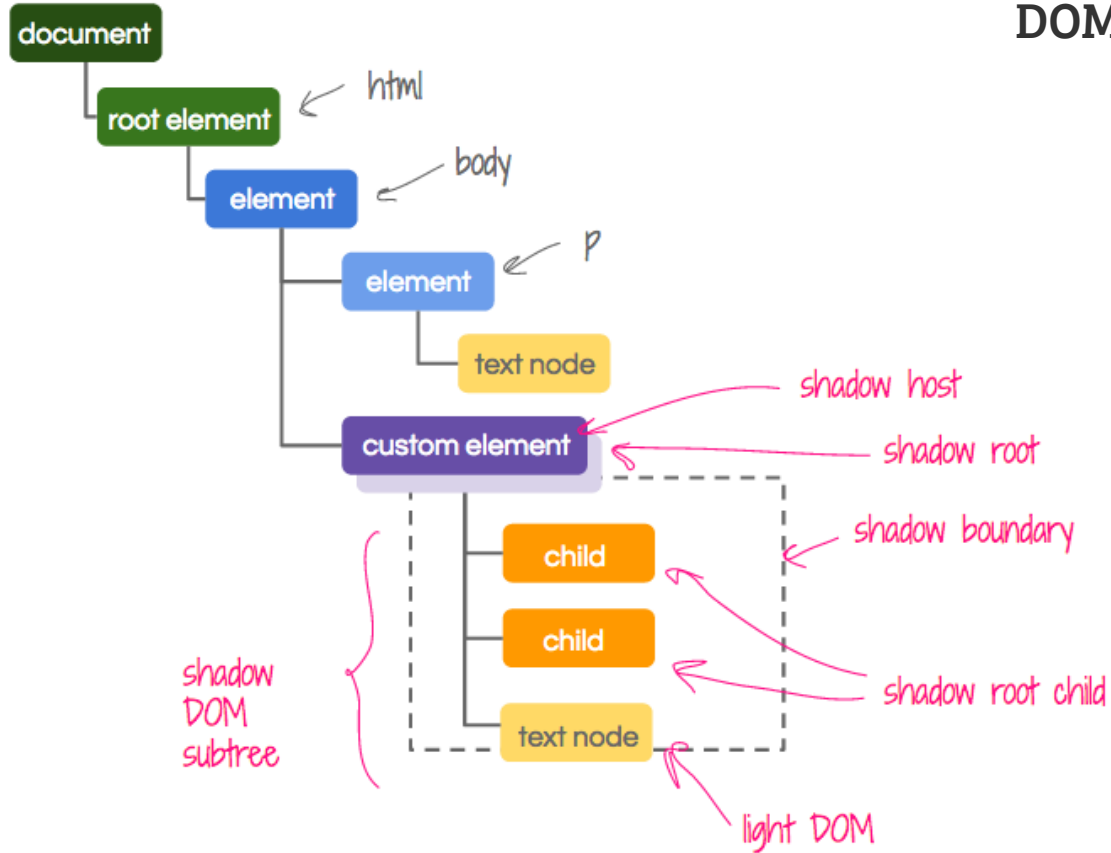

body {
 padding: 0;
 margin: 0;
 font-family: "RobotoDraft", "Helvetica Neue", "Segoe UI Web Regular", "Segoe UI", "Helvetica", "Arial", sans-serif;
}

Find in Styles

Dissecting Custom Elements

- Element → *Shadow Host*
- The root of shadow DOM subtree → *Shadow Root*
- Shadow DOM subtrees → *Shadow DOM*
 - Children
 - Children visible to end user → *Light DOM*

DOM & Shadow DOM

DOM: Creating a Node

```
<div id="parent"></div>
```

```
var parent = document.querySelector('#parent');  
var child = document.createElement('div');  
parent.appendChild(child);
```

Shadow DOM: Creating a Node

```
<div id="host"></div>
```

```
var host = document.querySelector('#host');
```

```
var shadowroot = host.createShadowRoot();
```

```
// To append a child node to the shadow root
```

```
var child = document.createElement('div');
```

```
shadowroot.appendChild(child);
```

Styling Shadow DOM: CSS Scoping

1. `:host` and `:host()` pseudo-class
2. `:host-context()` pseudo-class
3. `::content` pseudo-element
4. `::shadow` pseudo-element
5. `>>>` shadow-piercing descendant combinator

:host

```
<element name="x-chat-list">
  <style>
    :host {
      border-bottom: 1px solid #eee;
      min-height: 72px;
    }
  </style>
  <div class="username"></div>
  <div class="text"></div>
  <template>...</template>
</element>
```

:host()

```
<element name="x-chat-list" class="fancy">
  <style>
    :host(.fancy) {
      border-bottom: 3px dashed LemonChiffon;
    }
    :host(:hover) {
      color: DarkSlateBlue;
    }
  </style>
  ...
</element>
```

:host-context()

```
:host-context(.fancypants) {  
  background-color: LavenderBlush;  
}
```

```
<div class="fancypants">  
  <x-chat-list></x-chat-list>  
</div>
```

::content

```
<element name="x-chat-list">
  <style>
    ::content span {
      font-weight: 400;
    }
  </style>
  <div class="username"><span>User: </span></div>
  <div class="text"></div>
  <template>...</template>
</element>
```

::shadow

```
x-chat-list::shadow > div {  
  min-height: 100px;  
}
```

```
<x-chat-list>  
  #shadow-root  
    <div>...</div> <-- this is selected  
</x-chat-list>
```

>>> combinator

Shadow-piercing descendant combinator

```
x-chat-list >>> div { ... }
```

```
<x-chat-list>
  #shadow-root
    <div> <-- all divs are selected incl. nested divs
      <div>
        <div></div>
      </div>
    </div>
  </x-chat-list>
```

>>> combinator

```
audio.fancy >>> input[type=range] {  
  background-color: CornflowerBlue;  
}
```
